Stormwater Management Report – Index Page

Project Name: Single Family Home Subdivision

Project Location: Lawrence, Mercer County, NJ

The following table summarizes typical additional information as required by the New Jersey Department of Environmental Protection Division of Land Use Regulation. Details can be found throughout this Stormwater Management Report, Appendices and Supplemental Reports at the places indicated below.

Drainage Report Information	Location of Information
Total Amount of Land Disturbed on Site – 0.507 Acres	Page #3
Acreage of New Impervious Surfaces – 0.28 Acres	Page #3
Type of Basin Proposed (Pervious Pavement System)	Page #4
Proof that Groundwater Recharge Standards are met	Appendix B
Recharge Worksheet	Appendix B
Proof that Runoff Quantity Standards are met	Appendix A
Proof that Water Quality Standards are met	Appendix A
Location of proposed basin in relation to depth of the seasonal high groundwater table	Page #7

Introduction

The purpose of this report is to analyze the stormwater drainage conditions that will occur as a result of the subdivision of lot 22 to create a total of three (3) Proposed Lots 12.01 (EDA-1 / PDA-1), 12.02 (EDA-2 / PDA-2) & 12.03 (EDA-3 / PDA-3) and construct a 2 - story Single Family Homes on each of the new lots, in the Township of Lawrence, Mercer County, New Jersey. At this time the proposed site build-out includes Two New Proposed 2 - story Single Family Homes, asphalt driveway, Roadway extension to provide access to the homes (EDA-4 / PDA-4) , as well as landscaping areas, stormwater management facility, utilities, and related site improvements. Each site has an underground Stormwater Management System (Drywell) adequately sized for each site. Additionally, we have analyzed the stormwater of the proposed roadway which has been designed to be collected by Pervious Paving System.

The site is located at block 2008, lot 22 of Lawrence, Mercer County, New Jersey. The site currently has a single family home and applicant proposes to maintain the existing home and subdivide the property to create two new lots with each with a new single family home. The proposed development does not disturb more than one Acre nor increase the impervious coverage by a quarter acre or more. According to the NJDEP State regulations the project is exempt from the water quality, water quantity and ground water discharge.

In an effort to improve the stormwater conditions of the proposed development, the applicant has chosen to reduce the generated water quantity flows by the proposed development to prevent runoff from affecting surrounding properties and to increase the ground water recharge by proposing an underground stormwater facility to recharge the roof runoff. Calculations documenting the design of the stormwater management system, as illustrated on the Site Plan drawing documents, prepared by DAETEL ENGINEERING, LLC which are accompanying this report.

2. Existing Site Conditions

The existing site conditions for the subject project are illustrated on the “Existing Drainage Area Map” which is included within Appendix of this report. The “Existing Drainage Area Map” is based on boundary & topography survey information shown hereon is taken from boundary & topography survey, prepared by RWC surveying by John J. Hanlon, Lic No. GS37589, L.S. dated 03/17/24. Existing stormwater runoff conditions were analyzed based on the site conditions from the survey, field inspection,

soil conditions as found in the UdstB Soil Survey for Mercer County, Under original conditions, the Site was contains one single family residential home on lot(s) 22

Topography

The topography of the site can be described as “mild” with slopes ranging from about Two (2) to ten (10) percent. The general topography of the site drains towards the Southeast of the site towards wetland.

Drainage

Under existing conditions, the site contains four (4) drainage areas, labeled as EDA-1, EDA-2, EDA-3, EDA-4 and consists of approximately 0.23 acres, 0.17 acres, 0.23 acres and 0.15 acres (study area) as illustrated on the accompanying “Existing Drainage Area Map” included within Appendix C.

- **Drainage Area EDA-1 (on-site):** This area encompasses approximately 0.23 Acres which contains an existing single family residential home which ultimately sheet flows onto the unimproved road draining to the existing wetland located at the end of the unimproved road.
- **Drainage Area EDA-2 (on-site):** This area encompasses approximately 0.17 Acres which contains a proposed single family residential home which ultimately sheet flows onto the unimproved road draining to the existing wetland located at the end of the unimproved road.
- **Drainage Area EDA-3 (on-site):** This area encompasses approximately 0.23 Acres which contains a proposed single family residential home which ultimately sheet flows onto the unimproved road draining to the existing wetland located at the end of the unimproved road.
- **Drainage Area EDA-4 (off-site):** This area encompasses approximately 0.15 Acres which the unimproved road draining to the existing wetland located at the end of the unimproved road.

Site Soils

Based on the USDA Natural Resources Conservation Service (NRCS) Web Soil Survey (and as shown on the Soil Survey Map located in Appendix C the soils within the overall drainage area are Udorthents Complex (UdstB), 0% to 8% slopes as shown on the Soil Map for Mercer County and classified as hydrologic soil group D.

3. Proposed Site Conditions

Post Development Conditions

Surface Cover/Development

Under proposed conditions, the developed area will require the disturbance of 0.507 Acres; and additional (new) impervious surfaces of 0.28 Acres. The runoff from the proposed impervious areas as well as the runoff from the proposed roof area of the two houses (clean) will be directed to the proposed drywells in the rear of the house. The Site has been designed to maintain similar to existing drainage patterns as the water will continue to drain in the Southeast direction towards the Wetlands as it does under existing conditions.

Drainage

The stormwater management facilities for the proposed development have been designed to maintain the natural, existing drainage patterns to the fullest extent possible and to meet appropriate regulatory requirements with respect to groundwater recharge, water quality, and peak flow reductions. Under post-development conditions, Four (4) main drainage areas are proposed as depicted on the accompanying Proposed Drainage Area Plans included in Appendix C and are as follows:

- **Drainage Area (PDA-1, 2 & 3) (on-site):**

Based on evaluating the Volume of the Difference from Proposed to Pre-Existing, conservative we the stormwater management design for this project consists of a series of one (1) precast concrete seepage pits (Drywell) for each site to fully detain the roof runoff generated by the 100 year- 60 minutes duration storm (Larger Volume). In case of system failure, the design proposes an emergency overflow through the slotted clean-out of the Roof drain system which will flow towards the rear of the property which will ultimately drain down to the existing wetlands which mimics existing drainage patterns.

- **Drainage Area PDA-4 (Pervious Paving System – Roadway Drainage):**

The stormwater and grading plan for the Site has been designed to include a Proposed Roadway which sheet flows the Pervious Paving System which control and collect stormwater runoff. The purpose of the Pervious Paving System is to achieve low impact development by providing non-structural stormwater control techniques per the New Jersey Stormwater Best Management Practices Manual. The Pervious Paving System minimize the impervious surface, while

increasing the time of concentration and providing opportunities for runoff treatment, runoff infiltration, and groundwater discharge.

Approximately 0.15 Acre of Impervious Paving System are proposed as part of the Site design. Please see Appendix C for Pervious Paving System calculations.

Green Infrastructure Stormwater Management Facilities

Pervious Paving Systems

To meet the various design parameters established by the jurisdictional authorities above, the construction of stormwater management facilities is proposed for this Site. According to the Stormwater Management Rules (N.J.A.C. 7:8-5.3), there are six (6) types of green infrastructure that may be used to satisfy the groundwater recharge, stormwater runoff quality, and stormwater runoff quantity standards. According to Table 5-1, Pervious Paving System meet all the requirements laid out in the BMP manual. Specifically, the Pervious Paving System has designed to detain the runoff from a majority of the Site, while infiltrating the water quality storm and reducing the rates of runoff leaving the Site. The bottom elevation of the proposed Basins is 59.90' msl which is at least 1' above the seasonal high ground water table (SHWT). The stormwater runoff from the home will be collected via an 6" proposed HDPE Pipe which will be conveyed to the proposed on-site dry wells. The majority of the remaining lawn areas will sheet flow directly to the Pervious Pavement System.

To provide the required reduction for the 2, 10 and 100-year storm events, the retention basins are designed to meet the NJDEP peak flow attenuation requirements from the developed area. The proposed lawn areas and driveway runoff will sheet flow towards the Pervious Paving System (4P). Additionally the Also the Pervious Paving System (4P) is designed to accommodate the proposed roadway extension.

The Pervious Paving System will have a series of 8" perforated underdrains that will be connected to a common outlet control structure from where the controlled discharge will leave the site. The proposed outlet pipe will discharge to existing grade with Rip Rap at the outlet point to safely control the concentrated runoff.

Outlet Control Structure

In order to control the outflow from the basins 4'x4' (interior dimensions) outlet structures are proposed. The outlet structure at the bottom of the Pervious Paving System (4P) has a 2.5 feet

long rectangular weir set at elevation 61.50' msl and a eight (8") inch orifice, set at elevation 60.55' msl, which ultimately drain to the municipal conveyance system via a 15" RCP Pipe Culvert which is set at 59.90' msl. At the top of the outlet structure is a 4'x4' grate, set at elevation 61.55' msl which is above the routing elevation of the 100-year storm event and below the emergency spillway elevation (61.90' low point of roadway).

4. Methodology

The stormwater management facilities have been designed in accordance with the local, county, and State requirements mentioned above.

Calculation Software

The calculations included within this report were performed using hydrologic software, HydroCAD (Version 8.00) by HydroCAD Software Solutions, LLC. The HydroCAD software was used to develop runoff hydrographs, outlet structure configurations, and detention basin routings using the SCS TR-20 methodology. Times of concentration calculations for the pre-development and post-development calculations were generated utilizing the SCS Method. All storm data for this project was generated using standard NRCS unit hydrographs.

Runoff “CN” Values

As described above, soil classifications for use with runoff curve numbers (CN) were taken from the NRCS Web Soil Survey (see Appendix A). Evaluation of this data indicates that soils within the existing and proposed drainage areas consisted of hydrologic soil groups “D” as defined within the United States Soil Conservation Service Manual *“Urban Hydrology for Small Watersheds”*, v. 1986.

Runoff CN values for the soil groups were assigned to various surfaces as follows:

Group D

<u>Ground Cover</u>	<u>CN Value</u>
Open Space (Poor)	89
Impervious/Building Areas	98

Runoff CN value calculations for pre-developed and post-developed basin were generated using HydroCad software and are included within Appendix A of this report.

Time of Concentration

The time of concentration and travel time (TC) calculations have been completed in accordance with Chapter 3 of the SCS Technical Release 55 Manual. The time of concentration is defined as the time for runoff to travel from the hydraulically most distant point of the watershed to a point of interest. Values of the time of concentration were determined for existing and proposed conditions based on land cover and slope of the flow path. Based on the size of the Project a Minimum TC of 10 Min has been assumed for the Roadway. Please refer to the Hydrograph Calculations included within Appendix A of this report.

Infiltration Rates

Infiltration rates were assumed the soil conditions in that the soils are classified as hydrologic soil groups “D” which are poor drained soils. Therefore, conservatively analyzed in the design we utilized no infiltration rate which will be field verified during construction. For the purposes of this design, a safety factor of at least two (2) was utilized in conjunction with the Darcy Equation $Q=KIA$, as set forth in the NJDEP Stormwater BMP Manual.

Seasonal Groundwater

Seasonal groundwater was assumed based on the subsurface conditions of the neighboring areas and conditions. As required, a one (1') foot minimum clearance has been proposed between the seasonal high-water elevation and the bottom of the retention basin and to be verified during construction and if unable to be maintained, contractor is notified to inform engineer of record.

Water Quality

Water quality for the proposed development is achieved by the NJDEP 1.25"/2-Hour water quality storm being routed through the retention basin. The enclosed calculations also show that the basins will drain in less than 72 hours as required by the Lawrence Township and NJDEP.

Groundwater Recharge

Groundwater recharge is be promoted by a Porous Pavement System and the overland relief of the runoff to the wetlands. The total area in the worksheet is the surface area of the basin. Based on the annual Ground Water Recharge Analysis (GSR-32 worksheet) and Soil Type the Project is exempt from Annual Recharge (Appendix B), We utilized the limit of disturbance for this analysis.

Water Quantity Reductions

The 2-, 10- and 100-year storm events will be detained and controlled by an proposed concrete weir, reducing the pre-existing runoff rates substantially and meeting the required reduction rates. The quantity reduction for post-construction development as detailed in the new NJDEP Stormwater Management.

For an area where the post-development runoff hydrograph is below the pre-development hydrograph, then both the proposed site peak runoff and runoff volume should not exceed the existing.

Regulations includes a 50% reduction for the 2-year storm, 25% reduction for the 10-year storm and 20% reduction for the 100-year storm per N.J.A.C. 7:8-5.6 (b) (3)

The following tables show the comparison between the pre-development and the post-development stormwater runoff rates for various discharge points and demonstrate that the site design meets the Peak Flow Rate Reduction Requirement by NJDEP.

Table 1: Pre-Development vs. Post-Development Runoff Rate Comparison

Point of Analysis (Link 5L vs. Link 6L)

Per NJAC 7:8-5.6 (b) (1)

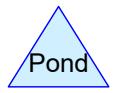

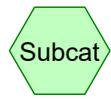

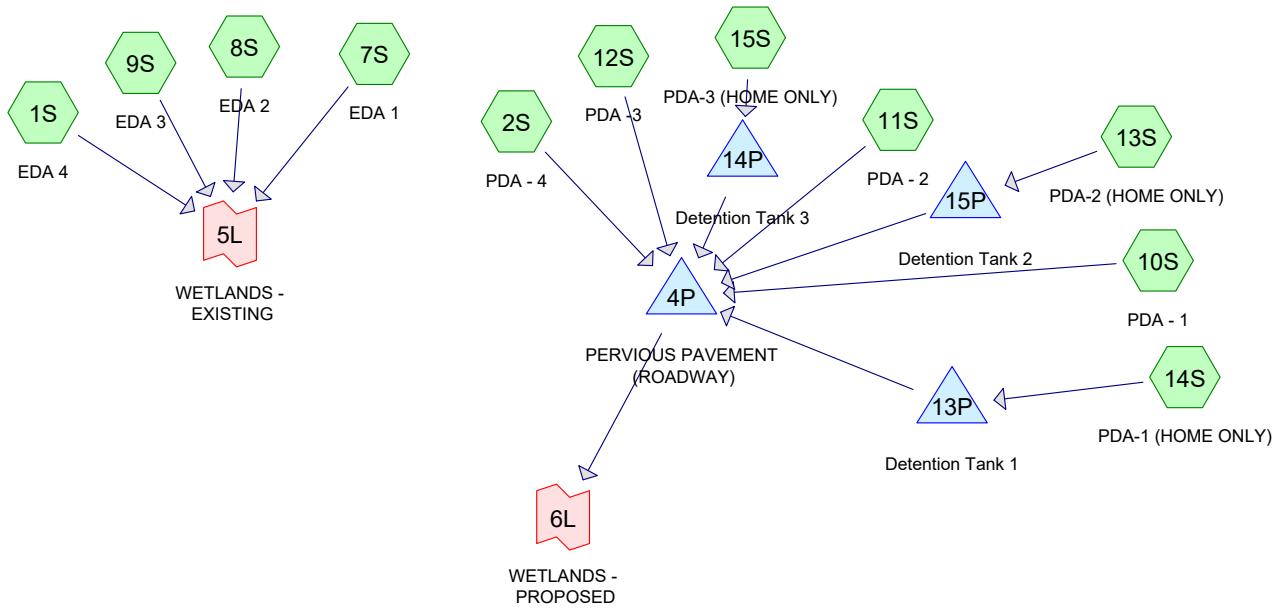

Design Storm	Pre-Development Runoff Rate (cfs)	Allowable (cfs)	Post-Development Runoff Rate (cfs)	Reduction Achieved
2-year	1.77	0.885	0.670	Y
10-year	2.98	2.235	2.070	Y
100-year	5.31	4.248	4.240	Y

5. Conclusion

In summary, the proposed development and stormwater management system illustrated on the drawings prepared Daetel Engineering, Inc. meets the requirements set forth by the current NJDEP Stormwater Management Regulations. The storm water management system for the project is designed to minimize the impacts of the developed areas on the downstream discharge points in accordance with the Lawrence Township, Mercer County and NJDEP regulations. The proposed development has been designed with provisions for safe and efficient control of stormwater runoff in a manner which will not adversely affect the existing drainage patterns found in the surrounding areas. The proposed development satisfies the NJDEP criteria for peak runoff rates for the 2-, 10-, and 100-year design storm frequencies and meets NJDEP criteria for water quality, groundwater recharge and TSS removal. It is evident that the proposed development will not adversely impact the existing drainage system.

Notes: The average point rainfall amounts listed above were developed from data contained in NOAA Atlas 14 Volume 2.

Point rainfall estimates for specific locations may be obtained from the Precipitation Frequency Data Server located at <http://www.nws.noaa.gov/ohd/hdsc/>

For most hydrologic design procedures, the rainfall amounts listed above may be rounded to the nearest tenth of an inch.

Total = 0.5				Total Annual Recharge (in)	Total Annual Recharge (cu.ft)
				0.0	-

Procedure to fill the Pre-Development and Post-Development Conditions Tables

For each land segment, first enter the area, then select TR-55 Land Cover, then select Soil. Start from the top of the table and proceed downward. Don't leave blank rows (with A=0) in between your segment entries. Rows with A=0 will not be displayed or used in calculations. For impervious areas outside of standard lots select "Impervious Areas" as the Land Cover. Soil type for impervious areas are only required if an infiltration facility will be built within these areas.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service

Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Mercer County, New Jersey

Survey Area Data: Version 19, Aug 29, 2023

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jun 4, 2022—Jul 22, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
UdstB	Udorthents, stratified substratum, 0 to 8 percent slopes	1.0	100.0%
Totals for Area of Interest		1.0	100.0%

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

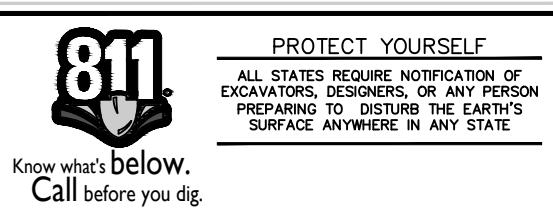

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however,
